

File package for Ozmosis

Beitrag von „pupokass“ vom 1. August 2024, 14:54

For those who do not want to search for all files on the Internet I publish a large package of ffs files for Ozmosis in this package there are such files as OpenPartitionDxe,OpenHfsPlus,latest Ozmosis version by [hyux1](#) and so on. See the screenshot for the rest of the files.All files are of the latest versions.According to the developer of this version of Ozmosis this version does not need

Kernel works well without KernnextPatcher but without DarBoot I suggest you try booting without DarBoot if something goes wrong with DarBoot working download it here again I reconfigured

it!

Beitrag von „hyux1“ vom 1. August 2024, 21:15

Kernnextpatcher should only be combined with this version if you want additional kernel or Kext patches. The configuration of kernnextpatcher must be adjusted.

If you want, you are welcome to make changes to the Ozmosis source code, then these patchers are no longer necessary.

Beitrag von „pupokass“ vom 1. August 2024, 21:25

I added it here if anyone who will use these files needs additional patches

Beitrag von „hyux1“ vom 1. August 2024, 21:29

I see that it has also been added to the download section by [Raptortosh](#). [Ozmosis 2023 Version](#)

Let's give the version a better name. 2023 version is not pretty. What do you think of Ozmosis Quattro 1.0?

Beitrag von „pupokass“ vom 1. August 2024, 21:32

That's a good name

Beitrag von „Raptortosh“ vom 1. August 2024, 22:00

Ich habe die Version in dem Thread als 2023 Version bezeichnet weil die davor auch so genannt wurde und dort nur ist damit die in dem dafür gedachten Bereich (Download Center) hochgeladen ist. Danke der Name spielt da keine wirklich Rolle, kaum jemand interessiert sich noch für Ozmosis...

Wieso "Quattro 1.0"? Sind wir nun bei Audi oder was?

Beitrag von „hyux1“ vom 3. August 2024, 16:53

The name would sound good. Good software, good name.

Updated package: GUIDs of some files have been corrected, kexts have been updated, file system drivers have been updated, a theme has been added, OzmosisDefaults.plist with updated SMBIOS iMac14.4 has been added to OzmosisDefaults.plist, an option to disable the built-in AptioFix has been added, as well as an option to configure your own framebuffer for the Intel video card (if you have a Sandy Bridge processor, you need to replace "AAPL, ig-platform-id" with "AAPL, snb_platform_id") to calculate the framebuffer for Ozmosis, you need to generate it in Clover configurator, copy all the characters after 0x and paste them into [this](#) calculator, insert the numbers that came out into the value AAPL, ig-platform-id, OpenRuntime has been replaced with OpenRuntimeFtw, quirks are set in it for ivy bridge, if you need to configure quirks, insert OpenRuntimeFtw in ROM click on the arrows on the left and find "Raw Section" click on this inscription with the right mouse button and click "Extract body" enter the name OpenRuntimeFtw.raw then open it in ProperTree or other similar programs then edit this file and save NECESSARILY check that the file has the extension .raw then click "replace body" and everything is ready, and also a package with compressed files was added. I also attach the kext2ffs utility in order to convert OzmosisDefaults from plist to ffs.
