

Hello, if someone could help me install macOS Big Sur or any version, I would really appreciate it.

Beitrag von „APDO“ vom 10. Januar 2025, 11:09

My components are:

i7 10700

Radeon RX 5700 XT 8G OC Edition

ASUS TUF Gaming Z490 Plus WiFi

ADATA Falcon 512GB 3D NAND PCIe Gen3x4 NVMe

I recently tried to do it on my own, but it hasn't worked when loading the USB.

I get this error (in the image), and I've tried everything I can, but I'm new to this. I would greatly appreciate it if someone could help me.

Ensure your config.plist is correctly configured for your hardware. You can use tools like ProperTree to edit your config.plist.

Beitrag von „APDO“ vom 10. Januar 2025, 14:37

I have already done it several times with ProperTree but each time I get a new error, I have uploaded to drive the Efi that I built, in case someone can access to see if I have made a mistake, I also add the Dortania's OpenCore Guide that I have used for this one.

<https://drive.google.com/file/...TdVfZVb5/view?usp=sharing>

<https://dortania.github.io/Ope...-lake.html#starting-point>

[APDO](#)

maybe switch to the opencore auxiliary-tools will help

--

--> <https://github.com/ic005k/OCAuxiliaryTools>

at first after running osaux make an update of the tool/opencoreversion itself

-> <https://www.youtube.com/watch?v=S6mE44a-Z-8>

lg 😊

..

600mb for an efi-folder, really?

edit-- the reason why---the [recoveryimage](#) is inside, unnecessary for taking a look over your efi...

--

uefi-mindate, minversion="-1"

uncheck "hideverbose"

nvrnm- 7C436110-AB2A-4BBB-A880-FE41995C9F82-csractiveconfig-030A0000

misc-security-securebootmode-disabled

that's so far atm

lg 😊
